

Too Good to Go

Product Requirements Document: - Storefront Redesign

Feature name: High-Revenue Storefront Optimization (Surprise Bag Clarity, Dynamic Add-ons, & Flex Pass Loyalty Subscriptions)

Date: June 7, 2026

1. PROBLEM

Price-conscious and dietary-restricted consumers experience high checkout hesitation and transaction anxiety on the Too Good To Go storefront because of blind "Surprise Bag" uncertainty and restrictive dietary risks. This results in depressed conversion rates, frequent cart abandonment, and low Average Order Value (AOV) for local merchants who are unable to effectively upsell excess capacity.

1a. Background & Dependencies

- Legacy constraint: The current core platform infrastructure only supports isolated, single-unit checkout actions; it does not natively possess multi-day multi-buy architecture or custom additive item catalogs.
- Dependency: Requires a backend core modification to support the "Flex Pass" multi-use wallet ledger, priority early-access reservation windows, and merchant-managed add-on SKU pricing.

1b. Target Use Cases

- As a dietary-restricted app user, I want to flag my dietary requirements and set a hard auto-cancel parameter so that I do not risk spending money on a surprise meal I cannot safely eat.
- As a frequent neighborhood commuter, I want to buy a flexible prepaid digital punch card for my favorite bakery so that I lock in long-term value and secure a priority window for daily leftovers.
- As a merchant kitchen owner, I want to showcase visual context of typical past surplus items and cross-sell high-margin fresh items at checkout so that I can increase my transaction value and offset daily operational losses.

1c. Current User Journey

1. User opens the Too Good To Go app, uses the map/list view to identify a local merchant, and taps on their storefront.
2. User lands on the storefront profile and sees a generic graphic header along with an ambiguous title labeled "Surprise Bag."

→ **Problem:** User experiences high hesitation because they cannot tell what category of food they will receive (e.g., bread loaf vs. frosted cupcakes, or meat vs. vegetarian options).

3. User looks for a way to let the store know about their dietary restrictions or allergy preferences before reserving.

→ **Problem:** There is zero UI support for dietary modification, causing vegetarian and vegan users to drop out of the purchase funnel completely out of fear of getting meat products.

4. User taps the "Reserve" button to secure the \$4.99 surprise bag.

→ **Problem:** The checkout screen is entirely transactional and flat, completely missing the opportunity to upsell relevant items, trapping the platform at low overall transaction margins.

2. PROPOSED SOLUTION

Redesign the merchant storefront to eliminate user blind spots and introduce a high-conversion upselling layout featuring local storytelling elements, mandatory merchant-vetted dietary tags, past bag visual carousels, automated check-out add-ons, and a prepaid "5-Bag Flex Pass" subscription model.

How it works: When a consumer arrives on a storefront, they are instantly greeted by a personalized 1-line local brand story from the owner to build community connection. When listing a bag for the day, merchants are mandated to tag whether they can accommodate vegetarian or vegan requests based on that specific day's batch. Users can view this live availability directly on the storefront and toggle a specific "Dietary Request" for that day's bag, backed by an automated fallback guarantee that cancels and refunds the order if the store runs out of matching options.

2a. Value Proposition

Price-conscious and dietary-restricted consumers who struggle with checkout hesitation due to blind "Surprise Bag" anxiety use the Optimized Revenue Storefront, a personalized upselling and multi-buy platform redesign, to buy local food with complete confidence and flexible bundle passes. Unlike the current transaction-isolated storefront, it provides data-driven category tags, auto-cancellation safety toggles, and instant point-of-sale cross-sells, helping users confidently save money while heavily boosting merchant revenue.

2b. Goals & Out-of-Scope

Goals

- Increase Average Order Value (AOV) across participating merchants by >25% through high-margin impulsive add-ons.

- Boost Storefront Checkout Conversion Rate from 44% to >65% by mitigating user anxiety via tags, safety toggles, and visual carousels.
- Drive repeat retention and predictable marketplace cash flow via upfront 5-Bag Flex Pass purchases.

Out-of-Scope

- Custom full-menu e-commerce fulfillment (the platform remains fundamentally a surplus-first engine; users cannot build custom full-price meals).
- Merchant-to-user live chat infrastructure or phone dialing options (all interactions must remain automated within standard UI components).

2c. Measurable Outcomes

Metric	How it's measured	Baseline	Target
Average Order Value (AOV)	Mean total financial size of transactions processed inside app checkouts	\$4.95	>\$6.80
Storefront Conversion Rate	% of users landing on a storefront profile who finalize a payment	44%	>65%
Customer Retention (30-Day LTV)	Average number of repeat orders submitted by a user within a 30-day window	1.8 bookings	>3.5 bookings

3. REQUIREMENTS

PRIORITY LABELS:

[P0] = Must ship. Without this, the feature doesn't work or deliver core value.

[P1] = Important for a good experience. Ship if at all possible.

[P2] = Nice-to-have. Build only if time allows.

User Journey 1: Consumer discovering and purchasing surplus food safely

Context: Optimizing the storefront experience to build instant trust, erase uncertainty, and drive impulsive point-of-sale spending additions.

Sub-journey: Evaluating the Storefront and Surprise Bag Contents

- **[P0]** User can view a prominent 1-line local storytelling pitch written by the merchant directly under the store banner to build community empathy.
- **[P0]** User can view quick-tap merchant-vetted category tags (e.g., [ Breads], [ Savory], [Pastries]) instead of typing manually.
- **[P0]** User can review an image carousel explicitly labeled "Examples of Past Surprise Bags" to anchor visual expectations.
- **[P0]** User can see internal credibility validation indicators without leaving the platform ecosystem, which it currently does.
- **[P1]** User can see a "Trust & Origin" badge system highlighting health, safety, or community certifications (e.g., Food Safety Certified).

Sub-journey: Setting Dietary Fallback Protection

- **[P0] System Mandate:** System forces the merchant to declare and tag if [Vegetarian Requests Allowed] or [Vegan Requests Allowed] for *every single surprise bag* at the exact time they publish their daily leftover inventory.
- **[P0]** User can select a specific Vegetarian or Vegan request toggle for that day's bag package during the selection flow.
- **[P0]** User can select a conditional logic fallback option that automatically voids and refunds the reservation if the store cannot fulfill that specific day's dietary constraint at pickup.

Sub-journey: Checking Out with Cross-Sell Add-ons

- **[P0]** User can view a dedicated, high-visibility impulse menu (e.g., "\$3 Fresh Coffee") embedded directly within the checkout sheet overlay.
- **[P0]** User can add a full-priced add-on SKU to their bag with a single tap.
- **[P1]** User can see a progress bar indicating how much more spend is needed to access specialized platform rewards or tier progression.

User Journey 2: High-Frequency Consumer locking in long-term local value

Context: Building recurring habit loops and securing upfront platform cash flow using the Flex Pass loyalty token framework.

Sub-journey: Purchasing and Managing the Flex Pass

- **[P0]** User can purchase a "5-Bag Flex Pass" at an upfront discounted rate (e.g., 15% off total value) directly from the storefront layout which can be used over 1-2 months.
- **[P0]** User can view a visual punch-card component tracking their remaining valid credits inside their user profile.
- **[P1]** User can automatically receive exclusive priority push notifications giving them a 30-minute early booking window before a favorited merchant's leftover inventory opens to the general public for the 5 bags bought in the pass.

4. APPENDIX

Design Decisions

- **Decision:** Implemented automated conditional cancellation checkboxes for dietary restrictions rather than an open-ended text input field.
- **Rationale:** Giving users an unstructured text field causes high operational friction for fast-moving cashiers behind counter lines. By programmatic filtering via a strict binary loop, we remove merchant liability and altogether avoid refund friction.
- **Alternative considered:** Keep surprise bags completely blind but offer a generic request window. Rejected because it led to high refund rates, friction at the cash register, and low consumer trust.

Open Questions

- How do we handle financial settlement structures with a merchant for unredeemed Flex Pass credits if the business permanently ceases operations before the 5 slots are cleared?

Owner: FinOps / Core Platform PM
